

F9 Four diagnostics, four verdicts: conservation cannot stand in for accuracy

(a) TRACK 1 - conservation is exact and therefore useless flat at roundoff for every run, including the negative ones

(b) TRACK 2 - non-negativity fails at a DIFFERENT h
dotted lines = frozen-Jacobian estimate (EE and RK4)

(c) TRACK 3 - the error is what actually distinguishes them
open markers = the run diverged before $t = 40$

(d) TRACK 4 - the terminal value, quoted with its digits
 $\times$ = no value: the run never reached $t = 40$
